The Evidence of an Early-Stage American Major Offensive Economic Military Campaign towards Global Resource Control: Seizing Control of and Ushering in a New Global Currency (Bitcoin) While Hyperinflating Existing Fiat Currencies

Abstract

America, while still extremely powerful, seems to be in a rapid decline:

- *It isn't performing well in the war against Russia through its NATO-occupied proxy, Ukraine.*
- *Its international reputation is being dragged through the mud by the genocide going on in the Israeli settler state in West Asia.*
- *Its economy is losing dominance - China has overtaken it to become the largest trading partner of a majority of nations in the world.*
- *Its regular practice of murdering people all over the world has earned it many enemies.*
- *Its corrupt and potentially sickening methods of political management (ex: Jeffrey Epstein) have many people doubting its morality.*
- *Its culture is losing popularity and being labeled as decadent and grotesque.*
- *Countries are realizing that the mRNA vaccines may not have been what they were told, and that the vaccines may have been a biological weapon.*

Yet, despite all these negative trends, recent policy decisions suggest that America has identified a new economic weapon that it could use to maintain its relevance in the global power game. America appears to have made a rapid strategic shift in economic military strategy and may be intending to unleash a mighty economic military campaign.

In short, the economic weapon is the Bitcoin Ponzi scheme, which the Americans are planning to utilize in order to deflate their mountain of debt to nothing, reset the monetary scorecard in their favor to come from behind to having a huge lead over the course of a handful of years, and secure a renewed iron grip of control of resources and labor in global markets the likes of which has never existed before.

In this paper, I outline with clarity what the Americans - courageous, creative, and cunning even in a decline - may be planning. Money is not simply a tool, it is a weapon used for resource extraction, and the Americans have been quietly setting the stage for a new monetary military campaign. The web has been spun, the onslaught has begun, and the situation may get out of hand very soon.

Figure 1. The logo of the Ponzi scheme that is taking the world by storm.

1. Introduction

Bitcoin is a decentralized "cryptocurrency" Ponzi scheme created in 2009 by a pseudonymous individual named Satoshi Nakamoto. It was first proposed to be "Internet cash" and had 0 value. Famously, an American bought two pizzas for 10,000 Bitcoin (now worth $1.2 billion USD) in May 2010. As hobbyists and speculators began to gather around the currency, its value began to quickly rise in rapid cycles of speculation and drawdowns. After rising to $30 USD in 2011, it reached $1,200 USD in 2013, $20,000 USD in 2017, $68,000 USD in 2021, and is currently at $118,000 USD. It's significant to note that barely anything about the Bitcoin system has changed since it was launched in 2009,

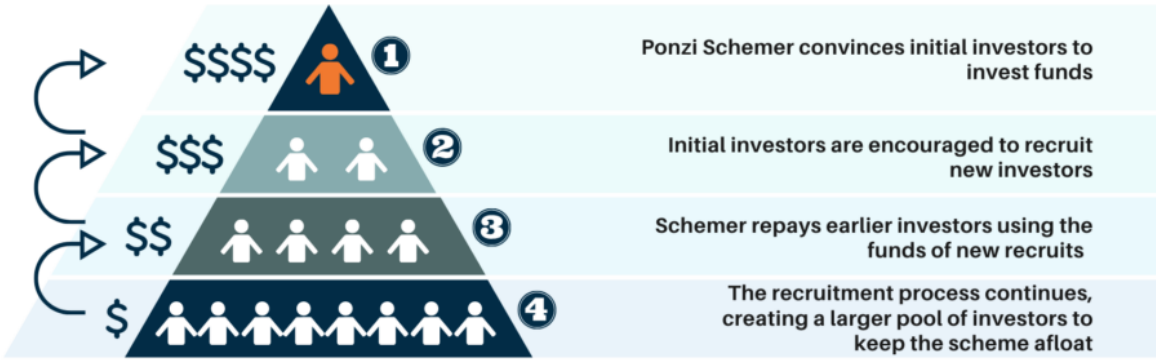

Figure 2. A diagram of a Ponzi scheme, where new entrants are attracted to pay off earlier entrants.

but what people are willing to pay for a Bitcoin has shot up at mind-boggling speeds, making its market cap valuation go from 0 to over $2 trillion US dollars in only 16 years. For reference, that makes Bitcoin's market cap valuation more than the monetary base of all but a few countries, and more than the GDP of all but a few countries as well.

Bitcoin is a Ponzi scheme (Figure 2). Its most earnest proponents claim that it's digital gold, and that it is better than fiat currency and that it will replace all financial assets and reach valuations of $10 million dollars. They also claim that its a good payment system and store of value because its cross-border, self-custodial, fixed fee, fixed supply, decentralized, and more fair than fiat currency. All these narratives are used to attract more people to buy Bitcoin so that the earlier investors can profit.

However, when being accurate, fiat currency is also a form of Ponzi scheme, typically run by governments. Governments create fiat currency and exchange it for resources, and can create more currency based on certain rules they decide. If the country conquers more territory, it can compel new people to "buy" the fiat currency by paying with their resources and labor so that the earlier holders of the currency can profit.

Recent policy and market decisions by The White House, powerful pools of money, banks, and the Trump family itself, coupled with an understanding of how Bitcoin can interact with fiat currencies, suggests that America is looking to make a long-term strategic monetary policy pivot by adopting the Bitcoin Ponzi at a national level as a new globally-deployable currency weapon for resource extraction. This has the following implications:

- America is finally openly defaulting on its US dollar Ponzi. All US-dollar denominated debt will quickly become worthless due to hyperbitcoinization. While soft-default has been the norm for a long time, this is tantamount to a declaration of war (Hint: America is always at war).

- The United States will, via hyperbitcoinization, at the same time, hyperinflate the value of all other fiat currencies in territories where Bitcoin is accepted to zero, and gain control of a majority of the supply of the new global currency (Bitcoin).

- Without the coordinated establishment and enforcement of a Bitcoin-free trading bloc, due to the global nature of Bitcoin, which runs over the Internet, America will become monetarily dominant across the globe, and control a majority of the world's resources and labor in all territories.

In my opinion, given the US government's quiet ongoing first-mover preparation, the lack of understanding and coordination of the worldwide masses, and Bitcoin's subversive nature of offering something to gain to whoever joins its Ponzi scheme, the battle has already been won by America. There will be no peaceful way to avoid the establishment of Bitcoin as the new global currency Ponzi scheme. In that light, the most reasonable response is either to prepare for war to attempt to force a different monetary standard on the world, or accept the defeat and join the ranks of the Ponzi scheme in some manner - the sooner it is joined, the more will be gained, or rather, the less will be lost.

In this paper, I explain exactly how America's economic military campaign will play out, the clues that it is planned, and provide policy suggestions on how to address this possibility.

2. Hyperbitcoinization

Before I discuss the recent evidence that America has decided to adopt the Bitcoin Ponzi scheme as an economic military weapon, I will explain "hyperbitcoinization", which refers to the process through which the Bitcoin Ponzi scheme will become the new global currency, and be used as a store of value, and more importantly, a medium of exchange and unit of account, which are the three academically defined uses of money. Perhaps more important than the ”what”, is the ”how”, because understanding how hyperbitcoinization occurs will help you understand what America seeks to gain and others will lose from this - everything. Ultimately, hyperbitcoinization refers to the progression of America’s monetary military campaign and the economic destruction and monetary poverty it will unleash on the rest of the world, which will likely only take a handful of years. Here are hyperbitcoinization’s basic steps, which would take anywhere from 3-10 years in my estimate once we reach the ”initiation stage”:

- **In the preparation stage, America signals its adoption of the Bitcoin Ponzi scheme at a national level, quietly accumulates the currency, establishes regulatory frameworks, and encourages adoption in other countries (already ongoing/complete).** The stage will be set with pro-Bitcoin legislation, regularatory clarity, and huge amounts of insider trading (which is the norm in America). At this stage, Bitcoin’s market cap is about 10% of the US monetary base, and represents approximately a 5% inflation of the USD monetary base (since America owns about half of Bitcoin).

- **In the initiation stage, America will announce that it will begin actively stockpiling Bitcoin in its Strategic National Bitcoin Reserve, funded by Federal Reserve money printing (explicitly or implicitly).** This will be the end of the old monetary order, and signal the beginning of America’s monetary military campaign. Overnight, other countries will realize what is happening, and not wanting to be left behind, will quickly scramble to follow suit. All manners of speculators, investors, and companies will jump into Bitcoin headfirst with abandon. Within weeks to months, Bitcoin will scream higher in price, reaching anywhere from $500,000 to $1,000,000 USD. At this stage, Bitcoin will create a 25% to 50% inflation of the monetary base, and fiat price inflation will begin to kick in slowly.

- **In the deployment stage, America and many other countries will proceed to inflate their fiat monetary bases (print currency) in earnest to directly purchase Bitcoin.** A global Bitcoin mania will commence from every source of capital. As this stage progresses over months and years, Bitcoin will reach prices of $10,000,000 USD, giving it a market cap of 200 trillion USD - a 500% inflation of the monetary base. At this stage, fiat price inflation will have kicked in noticeably and substantially, mainly within the USA, but will still be within reasonable bounds (1-10x increase in prices). At this stage, sovereign debt markets will have imploded, and due to fiat inflation, fiat debt’s purchasing power will quickly evaporate.

- **In the destruction stage, Bitcoin takes shape as the new global currency by being adopted as a medium of exchange and unit of account**. The global collapse of capital into Bitcoin will occur, as everyone realizes what is happening, and countries will not be prepared, willing, or able to stop the flood of Bitcoin into their territory due to lacking protected Internet territory, and will instead print currency like mad to purchase Bitcoin. At this stage, people will begin to completely discard fiat currency and only use Bitcoin. At first, they will transact in Bitcoin but quote prices in dollars. But at some point, the fiat prices will become so unstable, hyperinflating every day, that quoting prices in units of Bitcoin will become the norm. The shift to Bitcoin as a global currency will be complete. At this stage, Bitcoin will reach prices of $100,000,000 USD and even 1 trillion USD, creating 5,000% and 50,000% inflation of the monetary base as it completely inflates fiat currency away into nothing. This stage will take year(s).

- **At the end of the military campaign, America’s economic dominance will be cemented as the majority owner of the new global currency.** No fiat currency will be used anywhere, except in territories/trading blocs that have successfully enforced complete Bitcoin bans. Prices for everything will be quoted in units of Bitcoin (or satoshis, which are 1/100,00,000 of a Bitcoin) and will be as stable as fiat currency prices today. Businesses will hold Bitcoin on their balance sheet and people will use Bitcoin as their bank account. America will have liquidated its debt, own the majority of the new global currency, gained an iron grip on monetary dominance everywhere across the globe the open Internet is used, and depleted the monetary savings of all other countries, becoming a new solo economic hegemon in a way that has never happened before in history.

It’s important to understand why price rises in Bitcoin create inflations of the monetary base and eventually, hyperinflation of fiat prices. The reason is because unlike gold bars, houses, or units of company stock, Bitcoin can be easily used as a medium of exchange in payment to directly pay for something. As Bitcoin’s price rises and more people accept it as payment for goods and services, suddenly, for every valuable good and service, there are not just dollars bidding up the price, but also Bitcoins which are worth more and more compared to the dollars. This creates fiat price inflation, and not only in consumer prices, but in anything that can be purchased for dollars, including real estate, stocks, planes, and so on. Right now, Bitcoin's market cap is 2 trillion dollars, which is still a small fraction of the US monetary base. But there is nothing stopping it from becoming multiples of the US monetary base, and this is in effect, the same thing as the US government creating tons and tons of new US currency through money printing. As Bitcoin's market cap inflates to many multiples of the fiat currency monetary base, fiat price inflation will eventually reach astonishing levels, resulting in hyperinflation and the adoption of the Bitcoin Ponzi scheme as the new global currency.

3. Stablecoins

There seems to also be an appetizer economic military campaign in the form of government-backed stablecoins which will effectively have a similar effect of replacing all weaker fiat currencies in countries that cannot block the distribution of the digital tokens into their territories. This has a similar effect of strengthening America's economic hegemony but should be viewed as laying the groundwork for, or even obscuring the ultimate plan of hyperbitcoinization, which is the real economic military campaign.

4. Evidence of Pre-Hyperbitcoinization Positioning by the US Ruling Class

The important thing you must take away from this section is that the plan to commence the hyperbitcoinization military campaign has already been set. National adoption of the Bitcoin Ponzi scheme has already occurred. Insider trading is the golden standard in America, and the insider trader positions have openly been taken. The regulatory changes have been made, and subtle but intentional forewarnings by the American president have been given.

4.1. National Adoption of the Bitcoin Ponzi Scheme

One sign that the Bitcoin military campaign is planned is the open adoption of Bitcoin Ponzi scheme rhetoric in national legislation. In March 2025, Donald Trump signed into law the "Establishment of the Strategic Bitcoin Reserve and United States Digital Asset Stockpile" Executive Order. Taking a look at the order (Figure 4, we see [17]:

- A blatant adoption of Ponzi scheme narratives: *"Bitcoin is the original cryptocurrency. The Bitcoin protocol permanently caps the total supply of bitcoin (BTC) at 21 million coins, and has never been hacked. As a result of its scarcity and security, Bitcoin is often referred to as "digital gold"."*

- A carefully worded notice that the hyperbitcoinization military campaign is planned for "America's prosperity": *"Because there is a fixed supply of BTC, there is a strategic advantage to being among the first nations to create a strategic bitcoin reserve. The United States Government currently holds a significant amount of BTC, but has not implemented a policy to maximize BTC's strategic position as a unique store of value in the global financial system. Just as it is in our country's interest to thoughtfully manage national ownership and control of any other resource, our Nation must harness, not limit, the power of digital assets for our prosperity."*

Figure 3. A pro-Bitcoin post Donald Trump made on his social media platform [7].

Bitcoin legislation is new and still developing. More updates are expected to come since it is very early in Trump's presidency. The current US government under Trump has very clearly shifted in support of the Bitcoin Ponzi scheme and "digital assets". In fact, Donald Trump has personally endorsed the Bitcoin Ponzi scheme on his social media accounts. For example, he recently (Figure 3) shared a pro-Bitcoin video clip on his Truth Social account, an action unique to a Bitcoin Ponzi scheme participant.

While there are many high-profile individuals who support the Bitcoin Ponzi scheme, one of the more notable figures aside from Trump is Larry Fink, an American billionare businessman who is the co-founder and CEO of BlackRock, the **world's largest money-management firm in the world** with over 10 trillion US dollars under management [20]. Fink was publicly on record several years ago calling the Bitcoin Ponzi scheme an *"index of money laundering"* [6], but now he appears to have done a 180, appearing on television repeating Ponzi scheme narratives and attempting to entice new entrants: *"If you're afraid of the debasement of your currency, or you're frightened of the economic or political stability of your country, you* *can have an internationally based instrument called bitcoin that will overcome those local fears," Fink said at a panel at the World Economic Forum in Davos on Wednesday... "I was with a sovereign-wealth fund during this week, and there was a conversation, should we have a 2% allocation? Should we have a 5% allocation? If everybody adopted that conversation, it would be $500,000, $600,000, $700,000 for bitcoin"* [13]. Such a sharp change in tune should leave us suspicious.

The WHITE HOUSE

PRESIDENTIAL ACTIONS

ESTABLISHMENT OF THE STRATEGIC BITCOIN RESERVE AND UNITED STATES DIGITAL ASSET STOCKPILE

The White House | March 6, 2025

By the authority vested in me as President by the Constitution and the laws of the United States of America, it is hereby ordered:

Section 1. Background. Bitcoin is the original cryptocurrency. The Bitcoin protocol permanently caps the total supply of bitcoin (BTC) at 21 million coins, and has never been hacked. As a result of its scarcity and security, Bitcoin is often referred to as "digital gold". Because there is a fixed supply of BTC, there is a strategic advantage to being among the first nations to create a strategic bitcoin reserve. The United States Government currently holds a significant amount of BTC, but has not implemented a policy to maximize BTC's strategic position as a unique store of value in the global financial system. Just as it is in our country's interest to thoughtfully manage national ownership and control of any other resource, our Nation must harness, not limit, the power of digital assets for our prosperity.

Figure 4. An executive order signed into law by Donald Trump establishing a Strategic National Bitcoin Reserve [17].

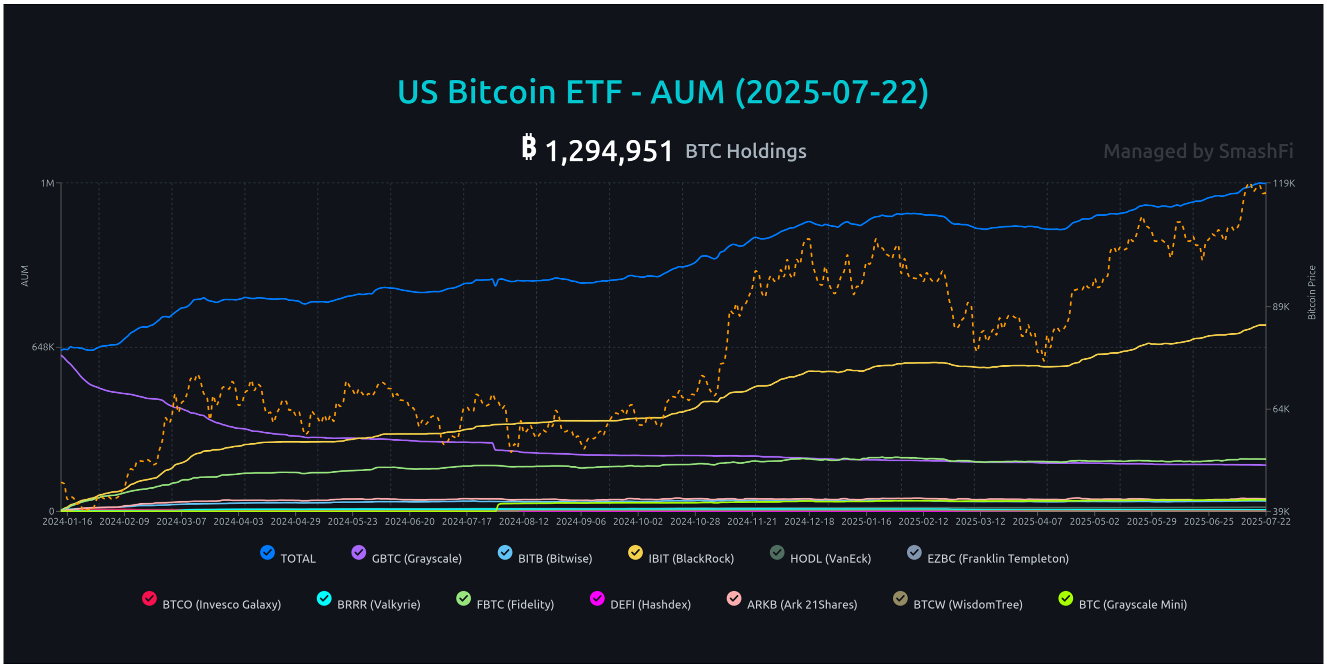

Figure 5. A chart showing the growth of Bitcoin under management by US Bitcoin ETFs since launch in January 2024 [14].

4.2. Insider Trading

What is perhaps even more informative than public Ponzi scheme endorsements is a significant amount of personal investments into the Bitcoin Ponzi scheme, ensuring the transformation of such invested individuals into Ponzi scheme members and advocates. Such actions have come from BlackRock and the Trump family itself, indicating that this may be insider trading. These individuals likely know more than they let on and may be preparing to take advantage of future US governmemnt policy decisions.

First I will note the Trump family's recent investments into the Bitcoin Ponzi scheme. Recently, it was announced that the Trump Media and Technology Group, a media and technology company majority-owned by president Donald Trump [21], had put **two-thirds** of its liquid assets into Bitcoin and Bitcoin-related securities, amounting to a dollar value of approximately 2 billion [8]. Such a move is **very significant** given the fact that it occupies significant size on the company's balance sheet, and should be viewed as no less than an all-in insider trading move.

Aside from the Trump family, what should raise our eyebrows even higher is the introduction and adoption of the Bitcoin Ponzi scheme as a highly sought-after offering in top money management firms, including BlackRock, which serves a wide range of institutional investors, including pension funds, endowments, insurance companies, central banks, and sovereign wealth funds [3]. Bitcoin Ponzi scheme ETFs were approved and began trading in January 2024 [5]. Since then, they have seen a mind boggling 655,000 Bitcoin of inflows (Figure 5) [14], representing about 77 billion US dollars of inflows at the current Bitcoin price of $118,000.

BlackRock is the most heavyweight money management firm in the world, and its clients are expansive and have significant pools of capital. They are not putting tens of billions of dollars into a Ponzi scheme as a form of nonchalant financial speculation. **The United States is quietly onboarding its key pools of institutional capital into Bitcoin before commencing its hyperbitcoinization economic military offensive.**

4.3. Stablecoins

As a final topic, I will cover the evidence for a clear policy shift on government-backed stablecoins, which I view as nothing more than a supportive smokescreen for the hyperbitcoinization military operation, but helps us understand the two-pronged approach of this economic offensive - first the blockchain-issued dollars, then the Bitcoin Ponzi scheme.

Recently, the President signed the GENIUS Act into law which allows the rollout of government-backed stablecoins. The official White House statement says, *"This long-overdue legislation creates the first-ever Federal regulatory system for stablecoins, ensuring their stability and trust through strong reserve requirements... In the event of insolvency of a stablecoin issuer, the GENIUS Act prioritizes stablecoin holders' claims over all other creditors, ensuring* *a final backstop of consumer protection... The GENIUS Act will generate increased demand for U.S. debt and cement the dollar's status as the global reserve currency by requiring stablecoin issuers to back their assets with Treasuries and U.S. dollars"* [18]. The mechanism through which this will allow for continued American resource extraction is quite straightforward and should help the reader understand the plan for Bitcoin, which is the same.

Scott Bessent, the current United States Secretary of the Treasury, had this to say on stablecoins in a recent interview: *"I think stablecoins could reinforce dollar supremacy... stablecoins could end up being one of the biggest buyers of US Treasuries... I think there's a very good chance that crypto is actually one of the things that locks in dollar supremacy... [crypto] is one of the most important phenomena that's happening in the world"* [19].

The entire shift to deploy blockchain-issued dollars should be seen as a recognition of the subversive power of financial systems that are native to the global open Internet, and the inability of victim nations to block financial weapons deployed on such systems. A recent statement by Trump on the GENIUS stablecoin act proves the Americans understand this: *"[it is] the greatest revolution in financial technology since the birth of the Internet... The entire ancient system will be eligible for the 21st century upgrade using state-of-the-art crypto technology"* [12]. Of course, the Americans are viewing the situation strategically and positioning themselves to be the beneficiaries of it. Considering Bitcoin's equivalent Internet-native form, and the recent insider trading positioning by the US ruling class, there should be no doubt that hyperbitcoinization is what the Americans are ultimately planning. Stablecoins are simply the jab before the uppercut.

4.4. Additional Regulatory Preparations

Several other key requirements for a hyperbitcoinization offensive seem to be falling in place. One is merchant point-of-sale solutions. Square, the US market leader in point-of-sale solutions, which also processed over 200 billion US dollars in transactions in 2023 [4], is planning for full availability of Bitcoin payments by 2026 [9].

The US is also moving quickly to recognize Bitcoin as mortgage collateral, which will allow US citizens to leverage their house to enter the Bitcoin Ponzi scheme. The US Federal Housing Finance Agency Director William Pulte reportedly, *"told Fannie Mae and Freddie Mac (the "government sponsored entities") to draft policies that would consider a borrower's cryptocurrency holdings as reserves or assets when qualifying for a mortgage, without requiring borrowers to convert those holdings into U.S. dollars, and cryptocurrencies under consideration would be those stored on a U.S.-regulated exchange"* [15].

Figure 6. A chart comparing the monetary qualities of Bitcoin, gold, and fiat currency.

5. A Geopolitical and Geofinancial Analysis

The United States is beginning to peddle a new Ponzi scheme to the world, planning to liquidate the other fiat currencies to zero and consolidate financial resource control. Most of the world will be unable to defend against it, giving them their labor and resources in the process. Many countries will be sold out by self-interested Bitcoiners or paid-off politicians. Due to the global nature of the open Internet, and the complex marketing narrative of the Bitcoin Ponzi scheme as "fixed-supply self-custodial digital gold", along with the grassroots entrenchment of Bitcoin Ponzi scheme in all parts of the world, I don't foresee many countries being able to stop this economic onslaught. I believe America, by seizing the initiative, is already far in the lead, and that unless we have war, America has already won over the future resources of a majority of global countries.

The end result of hyperbitcoinization is that in a similar way that the Euro presides over many countries in Western and Central Europe, Bitcoin will become a currency that presides over all countries that are not able to block the distribution of the Ponzi scheme tokens into their country, and the majority of it will be owned by America, which has already begun to onboard its institutions and establish insider trading positions.

The only countries that will be able to protect their fiat currencies from getting liquidated to zero, and their resource markets drained, are countries that can enforce complete bans on using the Bitcoin Ponzi scheme to buy goods and services. To my current knowledge, there are almost no countries that will be able or willing to do this.

Bitcoin would directly complete with a new BRICS currency in all countries, since Bitcoin, as a global currency, will be "backed" by goods and services from basically every country in the world, including the United States. The Bitcoin Ponzi scheme will also benefit from the credible narratives that it's self-custodial, and more importantly, fixed-supply (Figure 6).

Once the Bitcoin Ponzi scheme has embedded itself into a country through the buy-in of key individuals, the odds of it leaving that country are extremely low, cementing that country as an economic colony for centuries (or more) to come.

The economic military campaign is well underway, and quickly making progress - the Bitcoin Ponzi scheme has embedded itself in key countries worldwide, and the US seems to be moving very quickly to prepare the offensive. Since most people don't understand exactly what is going on, there will be no way they can defend against it, and they will become victims.

It should be noted that such a military campaign would solve nearly all US fiscal problems - it would consolidate fiat capital into digital tokens that can be easily seized by the state through custodial chokepoints, establish significant government financial reserves, hyperdeflate the exorbitant piles of dollar-denominated debt and their interest payment obligations, and solve the problematic trends of dedollarization of global trade and forex reserves. Bitcoin ponzi proponents understand this perfectly well and have likely detailed these exact possibilities to the US government.

5.1. The Subversive Grassroots Infiltration of Bitcoin Worldwide

A close look at all public Bitcoin ETFs and Bitcoin treasury companies shows that there is significant adoption of the Bitcoin Ponzi scheme in the USA, Canada, South America, Europe, Australia, South Korea, Japan, and Hong Kong. Of all the countries, the USA seems to have the biggest lead - it is believed that Americans own 40 percent of all Bitcoin [1].

5.2. The Potential Future Purchasing Power of Bitcoin

If hyperbitcoinization occurs, eventually, Bitcoin will no longer have a fiat price (i.e. infinite dollars per Bitcoin) since fiat will be abandoned. However, at the same time, fiat prices will have hyperinflated. So how can we predict what the purchasing power of one Bitcoin would be in such a world?

Hal Finney, the first person to receive a Bitcoin transaction, famously predicted in 2009 that Bitcoin could reach a price of $10 million USD per coin (Figure 11). Compared to the price multiples that Bitcoin has done so far, that prediction is now very close - less than 100x away. Bitcoin has already completed many 100x price increases.

A great visualization (Figure 10) on this is done by Jesse Myers, a Bitcoin analyst [10], which compares the asset value of the Bitcoin Ponzi scheme to other assets, showing that there is still a lot of room to grow. If hyperbitcoinization occurs, at the very least, Bitcoin will vaporize the value of bonds and money to 0 and completely replace them.

It is impossible to predict exactly because the value of money depends on how much is spent and how much is saved, but I estimate that $10 million USD (in present-day purchasing power) is the absolute bare minimum one Bitcoin would be worth after hyperbitcoinization, and that it could potentially be as high as $100 million USD [11].

It's interesting that the system can be configured to only allow a
certain maximum number of coins ever to be generated. I guess the
idea is that the amount of work needed to generate a new coin will
become more difficult as time goes on.

One immediate problem with any new currency is how to value it. Even
ignoring the practical problem that virtually no one will accept it
at first, there is still a difficulty in coming up with a reasonable
argument in favor of a particular non-zero value for the coins.

As an amusing thought experiment, imagine that Bitcoin is successful anc
becomes the dominant payment system in use throughout the world.  Then
the
total value of the currency should be equal to the total value of all
the wealth in the world. Current estimates of total worldwide household
wealth that I have found range from $100 trillion to $300 trillion. With
20 million coins, that gives each coin a value of about $10 million.

So the possibility of generating coins today with a few cents of compute
time may be quite a good bet, with a payoff of something like 100
million
to 1! Even if the odds of Bitcoin succeeding to this degree are slim,
are they really 100 million to one against? Something to think about...

Hal

6. Policy Options to Mitigate the Offensive

Crypto and finance is already a very broadly discussed topic. The main purpose of this document is to illustrate the strategic nature of the American government's recent pivot to Bitcoin and what they may be planning. Therefore I will keep this section very brief and simply recommend minimum viable peaceful policy suggestions based on the information and narrative I have outlined in this document.

I suggest the following minimum-viable policy decisions:

- Consolidate holdings of other "altcoin" Ponzi scheme tokens (including Ethereum) into Bitcoin, to be used as future global currency forex reserves.
- Given that some nations may prove incapable of effectively containing the Bitcoin Ponzi scheme—posing hyperinflation risks to their fiat currencies, nations should strategically divest their forex reserves denominated in those currencies and acquire Bitcoin instead, thereby preserving the real value of their reserves.

For the sake of comprehensiveness, I will also mention other options which require more proactive efforts, and may be infeasible:

- Non-peaceful establishment and enforcement of new monetary systems.
- The creation and expansion of Bitcoin-free trading blocs, which would require the expansion of a Bitcoin firewall.
- The creation and distribution of a competing form of digital money which can be distributed over the Internet and can outcompete Bitcoin in fundamental monetary qualities for consumers.
- Overcutting America by adopting and accumulating Bitcoin before it while maintaining strict control of local resource markets.

If the US ever announces that it will begin a "buying program" to target accumulating certain amounts of Bitcoin in the Strategic Bitcoin Reserve, which can only happen through money printing since the US has run a budget deficit for two decades straight, then nations should know that the economic military offensive campaign I've outlined in my paper has progressed to its next step, and will progress as I've described, barring any disturbances. There are many rumors about this, and based on what I've outlined in my paper, I believe the writing is on the wall, and that it could happen in Donald Trump's current presidential term.

Nations should not become complacent in understanding and reacting to America's creative economic military plans. **The potential consequences are a world where the US controls a majority of the world's new global currency to the tune of gaining 100+ trillion US dollars of reserves (in Bitcoin) and completely liquidates the value of its existing debt obligations and fiat currency.** Given the free spirit of America and the potentially massive advantages it could gain, it would be a mistake to assume the Americans are incapable of or unwilling to commence an economic military operation as I've outlined in this paper - to be the first adopters of, accumulate, market, and distribute the new global currency Ponzi scheme, **as they are already beginning to do**, maintaining the *"exorbitant privilege"* of those who control the supply of the global reserve currency.

7. Conclusion

In this paper, I have identified a new and unexpected style of economic military warfare that the US is planning to commence. While the scenarios outlined in this paper may seem outlandish, such scenarios are proposed as realistic future scenarios by many individuals who have long been in the Bitcoin space such as Adam Back and Michael Saylor. If this situation is not handled properly, it can lead to not only the rapid devaluation of significant amounts of financial reserves that nations have spent decades accumulating through sweat, blood and tears, but also the gain of an unthinkably gargantuan lead by America in a new robust global currency system that **could not be overtaken peacefully in hundreds of years.**

Thank you for your attention to this matter!
